Let's use Blagden's Law to solve it.
$\mathrm{Tf}=\mathrm{Kf}{ }^{*} \mathrm{~b} * \mathrm{i}$; For water $\mathrm{Kf}=1.853 \mathrm{C} \cdot \mathrm{kg} / \mathrm{mol}$; $\mathrm{i}=2$ since we're having two ions from sodium chloride. Molality of the solution is $(32 / 58.5) * 1 / 0.555=0.98 \mathrm{~mol} / \mathrm{kg}$
Therefore $\mathrm{T} \mathrm{f}=1.853 * 0.98 * 2=3.63 \mathrm{C}$
