## Answer on Question \#40494-Chemistry - Other

## Question:

When calcium carbonate is added to hydrochloric acid, calcium chloride, carbon dioxide, and water are produced.

CaCO3(s) $+2 \mathrm{HCl}(\mathrm{aq})---\mathrm{CaCl} 2(\mathrm{aq})+\mathrm{H} 2 \mathrm{O}(\mathrm{I})+\mathrm{CO} 2(\mathrm{~g})$
1)How many grams of calcium chloride will be produced when 29.0 g of calcium carbonate are combined with 14.0 g of hydrochloric acid?
2)Which reactant is in excess and how many grams of this reactant will remain after the reaction is complete?

## Solution:

We need to know amount of each reactant:
$\mathrm{n}\left(\mathrm{CaCO}_{3}\right)=29.0 / 100.1=0.29 \mathrm{~mol}$
$\mathrm{n}(\mathrm{HCl})=14.0 / 36.5=0.38 \mathrm{~mol}$
Calcium carbonate is in excess
$\mathrm{m}\left(\mathrm{CaCl}_{2}\right)=111.1 * 0.38 / 2=21.1 \mathrm{~g}$
After the reaction is complete calcium carbonate will remain
$m\left(\mathrm{CaCO}_{3}\right)=(0.29-0.38 / 2) * 100.1=10.0 \mathrm{~g}$

## Answer:

1) 21.1
2) 10.0 grams of calcium carbonate
