## Answer on Question \#41595, Chemistry, Inorganic Chemistry

## Question:

8. Calculate the maximum number of mole of $\mathrm{Ba} 3(\mathrm{PO} 4) 2$ when 0.6 mole of BaCl 2 is mixed with 0.6 mole of Na 3 PO 4 .

## Solution:

$$
3 \mathrm{BaCl}_{2}+2 \mathrm{Na}_{3} \mathrm{PO}_{4}=2 \mathrm{Ba}_{3}\left(\mathrm{PO}_{4}\right)_{2}+6 \mathrm{NaCl}
$$

According to the stoichiometric ratio, sodium phosphate is in excess; hence, barium chloride is the limiting reactant.
$\mathrm{n}\left(\mathrm{Ba}_{3}\left(\mathrm{PO}_{4}\right)_{2}\right)(\mathrm{mole})=\mathrm{n}\left(\mathrm{BaCl}_{2}\right)^{*} 2 / 3=(0.6 / 3) * 2=0.4 \mathrm{~mol}$

Answer: 0.4 mol
