## Answer on Question \#42754-Chemistry - Physical Chemistry

## Question:

A sample of oxygen occupies a volume of 325 mL at $35^{\circ} \mathrm{C}$. What volume will it occupy at $85{ }^{\circ} \mathrm{C}$ ?

## Answer:

Charles's law states that the volume of a gas varies directly with the Kelvin temperature, assuming that pressure is constant. We use the following formula:

$$
\begin{gathered}
\frac{V_{1}}{T_{1}}=\frac{V_{2}}{T_{2}} \text { or } V_{1} \times T_{2}=V_{2} \times T_{1} \\
K=C^{0}+273 \\
\frac{325 \mathrm{ml}}{35+273}=\frac{V_{2}}{85+273}
\end{gathered}
$$

Then $V_{2}=377.8 \approx 378 \mathrm{ml}$
Answer: 378 ml.
