

Question:

What is the maximum mass of H₂O that can be produced by combining 66.6 g of each reactant in the equation $4 \text{NH}_3_{(g)} + 5 \text{O}_2_{(g)} = 4 \text{NO}_{(g)} + 6 \text{H}_2\text{O}_{(g)}$

Answer:

One can calculate the amount of moles of each reagent:

$$n(\text{NH}_3) = \frac{m(\text{NH}_3)}{M(\text{NH}_3)} = \frac{66.6 \text{ g}}{17 \text{ g/mol}} = 3.9 \text{ mol}$$

$$n(\text{O}_2) = \frac{m(\text{O}_2)}{M(\text{O}_2)} = \frac{66.6 \text{ g}}{32 \text{ g/mol}} = 2.1 \text{ mol}$$

The limiting reagent is O₂, because there is an excess of ammonia NH₃ in the system. The maximum mass of water obtained according to the reaction equation has to be calculated after the amount of moles of oxygen gas O₂. If 5 of oxygen O₂ produces 6 moles of water H₂O, than 2.1 mole of O₂ can produce:

$$m(\text{H}_2\text{O}) = \frac{2.1 \text{ mol} \times 6}{5} = 2.5 \text{ mol}$$

The corresponding mass of water is the maximum possible mass of water produced:

$$m(\text{H}_2\text{O}) = n(\text{H}_2\text{O}) \times M(\text{H}_2\text{O}) = 2.5 \text{ mol} \times 18 \text{ g/mol} = 45 \text{ g}$$
