## Answer on Question \#48775, Chemistry, Other

## Task:

Carbon dioxide, $\mathrm{CO}_{2}$ is added to a tank containing nitrogen at 2.00 atmospheres and oxygen at 1.00 atmosphere until the total pressure within the tank is 4.6 atmosphere what is the partial pressure of the $\mathrm{CO}_{2}$ ?

## Answer:

According to Dalton's Law, in a mixture of non-reacting gases a total pressure is equal to the sum of partial pressures of individual gases.

$$
\begin{aligned}
& P=\sum_{i=1}^{n} p_{i} \\
& p\left(\mathrm{CO}_{2}\right)=P-\left(p\left(N_{2}\right)+p\left(O_{2}\right)\right) \\
& p\left(\mathrm{CO}_{2}\right)=4.6-(2+1)=1.6 \mathrm{~atm}
\end{aligned}
$$
