

Answer on Question #55490 – Chemistry – Other

Question:

Part 1: An old supply of nitrogen gas held in a 0.250 m³ tank inside a hospital storage room exerts a pressure of 1.11 atm at 303 K. Calculate the density of the nitrogen gas in units of (g/L).

Part 2: Refer to Part 1. For waste disposal, the gas is moved to a 22.0 L container, and cooled to a temperature at which the gas pressure is 8.60 x 10³ mm Hg. Calculate the final temperature of the gas in absolute Kelvin.

Part 1:

Solution:

$$V_1 = 0.250 \text{ m}^3 = 250 \text{ L};$$

$$P_1 = 1.11 \text{ atm} = 112470.75 \text{ Pa} = 112.47075 \text{ kPa};$$

$$T_1 = 303 \text{ K};$$

$$M(\text{N}_2) = 28 \text{ g}\times\text{mol}^{-1};$$

D - ?

According to the ideal gas law:

$$PV = nRT;$$

P – the pressure (Pa or atm or mm Hg);

V – the volume (L or m³);

N – the amount of substance (mol);

R – the universal gas constant (8.314 J×K⁻¹×mol⁻¹ or 8.314 L×kPa×K⁻¹×mol⁻¹);

T – the temperature (K);

$$n = \frac{m}{M}; PV = \frac{m}{M}RT; D = \frac{m}{V};$$

M – the molar mass (g×mol⁻¹);

$$m = \frac{PVM}{RT}; D = \frac{m}{V} = \frac{PVM}{RTV} = \frac{PM}{RT};$$

$$P = 112.47075 \text{ kPa};$$

$$T = 303 \text{ K};$$

$$M(\text{N}_2) = 28 \text{ g}\times\text{mol}^{-1};$$

$$R = \text{or } 8.314 \text{ L}\times\text{kPa}\times\text{K}^{-1}\times\text{mol}^{-1};$$

$$D = \frac{112.47075 \times 28}{8.314 \times 303};$$

$$\underline{D = 1.25 \text{ g/L;}}$$

Answer: 1.25 g/L;

Part 2

Solution:

$$V_1 = 250 \text{ L;}$$

$$V_2 = 22.0 \text{ L;}$$

$$P_1 = 112.47075 \text{ kPa;}$$

$$P_2 = 8.6 \times 10^3 \text{ mm Hg} = 1146.573 \text{ kPa;}$$

$$T_1 = 303 \text{ K;}$$

$$T_2 = ?$$

According to the Boyle's law:

$$\frac{P_1 V_1}{T_1} = \frac{P_2 V_2}{T_2}; T_2 = \frac{P_2 V_2 T_1}{P_1 V_1};$$

$$T_2 = \frac{1146.573 \times 22 \times 303}{112.47075 \times 250} = 271.82 \text{ K;}$$

$$\underline{T_2 = 271.82 \text{ K;}}$$

Answer: 271.82 K
