## Answer on Question #71306 – Chemistry – Other

## Task:

Calculate the standard enthalpy of combustion of methane. Given that standard enthalpy of carbon and hydrogen are -393.5 kJ/mol and -283.83 kJ/mol. Standard enthalpy of formation of methane, is -75.16 kJ/mol?

## Solution:

Write the equation and balance the reaction of combustion of methane:

$$CH_4 + 2O_2 = CO_2 + 2H_2O$$

Write the equation and balance the reaction of formation of methane:

$$C + 2H_2 = CH_4$$
,  $\Delta_f H(1) = -75.16 kJ / mol.$ 

Write the equation and balance the reaction of combustion of carbon:

$$C + O_2 = CO_2$$
,  $\Delta_f H(2) = -393.5 kJ / mol$ .

Write the equation and balance the reaction of combustion of hydrogen:

$$H_2 + \frac{1}{2}O_2 = H_2O, \quad \Delta_f H(3) = -283.83 \, kJ \, / \, mol.$$

The calculation for the heat of combustion for methane using Hess's law:

Heat of reaction = 
$$\Delta_c H = -\Delta_f H(1) + \Delta_f H(2) + 2 * \Delta_f H(3)$$

*Heat of combustion* =  $\Delta_c H(CH_4) = 75.16 - 393.5 + 2*(-283.83) = -886 kJ / mol$ 

So, the heat of combustion, that is, the heat of reaction, is – 886 kJ per mole of methane.

**Answer:** The standard enthalpy of combustion of methane is -886 kJ/mol.
