

In 0.25 liters of solution contains 2.3 gm of non-electrolite at 17°C and osmotic pressure is 488.2kPa. Find molecular weight of this non-electrolite solution.

Solution

To find molecular weight of non-electrolite solution we should use Mendeleev-Clapeyron equation as far as substances dissolved in non-electrolite solution behave as gases.

$$PV = nRT; \quad n = m/M;$$

$$PV = RTm/M,$$

$$M = RTm/PV.$$

$$m = 2.3 \text{ gm},$$

$$T = 273 + 17 = 290 \text{ K},$$

$$P = 488200 \text{ Pa},$$

$$R = 8.314 \text{ JK}^{-1}\text{mol}^{-1},$$

$$V = 0.25 \text{ L} = 0.25 \text{ dm}^3 = 0.25 \cdot 10^{-3} \text{ m}^3.$$

$$M = 8.314 \cdot 290 \cdot 2.3 / (488200 \cdot 0.25 \cdot 10^{-3}) \cong 45 \text{ (gm/mol)}.$$

Answer: 45 gm/mol.
