## Answer on Question \#76947 - Chemistry - General Chemistry

Can we change limiting reactant in chemical reaction to increase the amount of required product? Like if zinc nitrate hexahydrate ( 15.0 g ) reacts with sodium hydroxide ( 16.0 g ) to produce zinc oxide (which was just 4.0 g ), then can we change the amount of reactants in such a way so that the amount of zinc oxide produced is more?

## Solution:

$\mathrm{Zn}\left(\mathrm{NO}_{3}\right)_{2}+2 \mathrm{NaOH} \rightarrow \mathrm{Zn}(\mathrm{OH})_{2}+2 \mathrm{NaNO}_{3}$
$\mathrm{Zn}(\mathrm{OH})_{2} \rightarrow \mathrm{ZnO}+\mathrm{H}_{2} \mathrm{O}$
$\mathrm{n}\left(\mathrm{Zn}\left(\mathrm{NO}_{3}\right)_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}\right)=\mathrm{m} / \mathrm{M}=15.0 \mathrm{~g} / 297.0 \mathrm{~g} / \mathrm{mol}=0.05 \mathrm{~mol}$
$\mathrm{n}(\mathrm{NaOH})=16.0 \mathrm{~g} / 40.0 \mathrm{~g} / \mathrm{mol}=0.4 \mathrm{~mol}$
$\mathrm{n}(\mathrm{ZnO})=4.0 \mathrm{~g} / 81.0 \mathrm{~g} / \mathrm{mol}=0.05 \mathrm{~mol}$
Zinc nitrate hexahydrate is limiting reactant
If we want more zinc oxide to be produced we must increase amount of $\mathrm{Zn}\left(\mathrm{NO}_{3}\right)_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$
