## Answer on Question \#38995 - Economics - Other

Given that the total cost function is
$T C=100 Q-Q^{\wedge} 2+1 / 3 Q^{\wedge} 3$
Where $Q=$ rate of output and TC=Total Cost
A. Determine the marginal and average cost functions
B. Calculate the output level that minimizes average cost
C. Calculate the output level that minimizes marginal cost

## Solution

$\mathrm{TC}=100 \mathrm{Q}-\mathrm{Q}^{\wedge} 2+1 / 3 \mathrm{Q}^{\wedge} 3$
A. Marginal function $\mathrm{MC}=\mathrm{TC}^{\prime}=100-2 \mathrm{Q}+\mathrm{Q}^{\wedge} 2$

Average cost function $\mathrm{ATC}=\mathrm{TC} / \mathrm{Q}=100-\mathrm{Q}+1 / 3 \mathrm{Q}^{\wedge} 2$
B. The output level that minimizes average cost is in the point, where $\mathrm{ATC}^{\prime}=0\left(\mathrm{ATC}^{\prime \prime}=1 / 3>0\right)$, so
$-1+2 / 3 \mathrm{Q}=0$,
$2 / 3 \mathrm{Q}=1$,
$\mathrm{Q}=1.5$ units
C. The output level that minimizes marginal cost is in the point, where $\mathrm{MC}^{\prime}=0\left(\mathrm{MC}^{\prime \prime}=1>0\right)$, so
$-2+2 Q=0$,
$2 \mathrm{Q}=2$,
$\mathrm{Q}=1$ unit.
