

Question #63692 - Economics – Microeconomics | Completed

Question

Steve's utility function is $U = BC$, where B = beer cans per week and C = pack of cigarettes per week. As a result, his marginal rate of substitution is $MRS = -B/C$, where beer is on the vertical axis and cigarettes are on the horizontal axis. Steve's income is \$120, the price of a can of beer is \$2 and that of a pack of cigarettes is \$1. [In answering the following, use graphs and math.]

A. How many cans of beer and packs of cigarette does Steve consume? (12)

B. Due to a new tax, the price to Steve of a can of beer rises to \$3. Now how much beer and how many packs of cigarettes does Steve consume? (13)

Answer

A) Optimal Steve's consumption is in the point $MU_B/P_B = MU_C/P_C$,

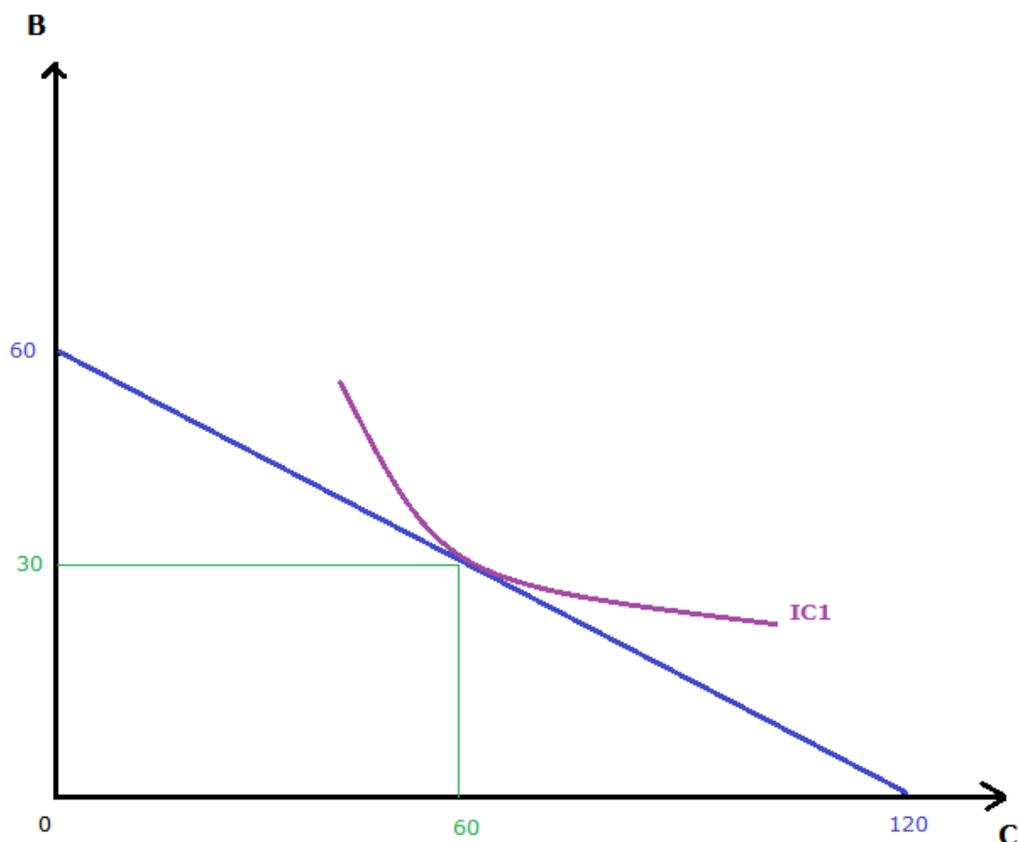

Steve's budget equation: $I = P_B * B + P_C * C \Rightarrow 2B + C = 120$,

where $MU_B = dU/dB = C$, $MU_C = dU/dC = B$

$MU_B/P_B = MU_C/P_C \Rightarrow C/2 = B$, put " $B = C/2$ " into $2B + C = 120 \Rightarrow 2*(C/2) + C = 120 \Rightarrow 2C = 120 \Rightarrow$

$\Rightarrow C = 60, B = C/2 = 30$

On the graph:

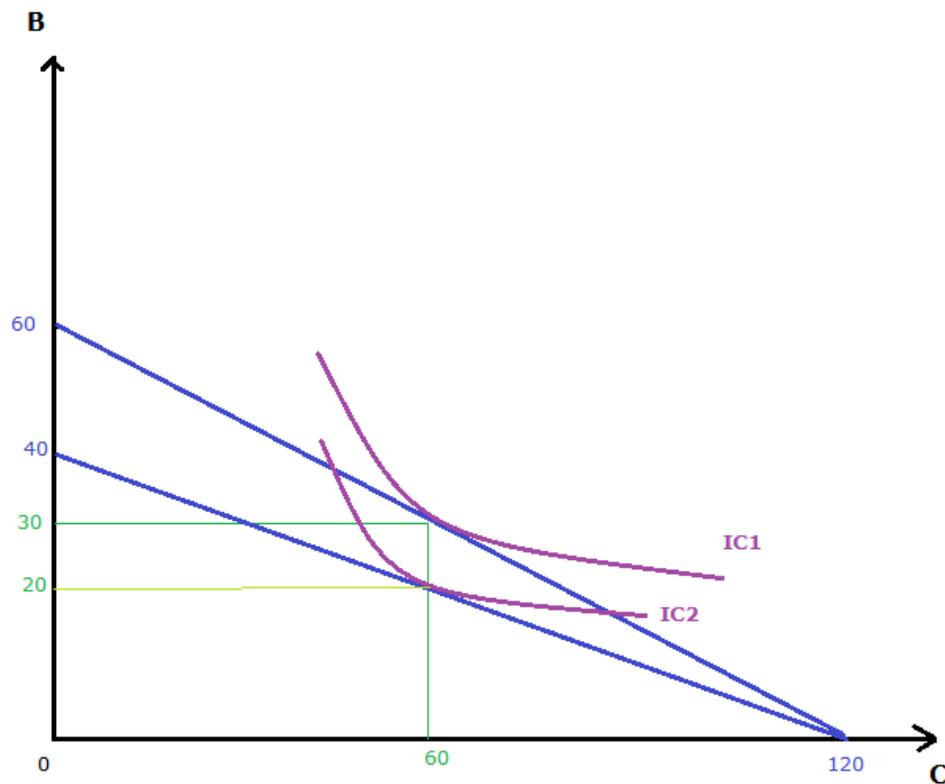

B) Steve's budget equation: $I = P_B \cdot B + P_C \cdot C \Rightarrow 3B + C = 120$,

where $MU_B = dU/dB = C$, $MU_C = dU/dC = B$

$MU_B/P_B = MU_C/P_C \Rightarrow C/3 = B$, put " $B = C/3$ " into $3B + C = 120 \Rightarrow 3 \cdot (C/3) + C = 120 \Rightarrow 2C = 120 \Rightarrow$

$\Rightarrow C = 60, B = C/3 = 20$

On the graph:
