## Question \#67406

Table 1. The calculation of Elasticity of Demand

|  | Case 1 | Case 2 | P - price level or value |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Case 1 | Case2 | Case 1 | Case2 | Case 1 | Case2 | Case 1 | Case2 | Case 1 | Case2 |
| Demand function form | $Q X=100-2 p^{2}$ | $Q X=100-2 p$ | 6 |  | 5 |  | 4 |  | 3 |  | 3to5 |  |
| dQX/DP | -4P | -2 | -24 | -2 | -20 | -2 | -16 | -2 | -12 | -2 |  |  |
| P/QX |  |  | 0.21 |  | 0.10 |  | 0.06 |  | 0.04 |  |  |  |
| Elasticity $=$ dQX/ $\mathrm{P}^{*}(\mathrm{P} / \mathrm{QX})$ |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  | -5.14 | -0.43 | -2.00 | -0.20 | -0.94 | -0.12 | -0.44 | -0.07 | -0.44 to -2.00 | -0.07 to -0.20 |

## Explanation of table 1

First, I will start to describe the content of the table. In the table one, we have represented 2 cases, as I do not understand clearly the form of the function of demand. However, I have done calculation for all possible cases I can imagine. As we can see there are case 1: $Q X=100-2 p^{2}$ and case $2: Q X=100-2 p$. $\partial Q X / \partial P$ shows the derivative of the function for each case: $-4 p$ and -2 . We also have price levels 6 and 3 to 5 : Under the price level, I have calculated the value of the derivative function $-4 p$ and -2 for each cases and for each level of price! The next step is the calculation of the expression $P / Q X$. The final step is the determination of elasticity for price 6 and for price 3-5.
a) In the table we can see that for case 1 , when price is six the elasticity will be equal to -5.14 . The result whispers us that when price is six, the demand will be declined for $5.14 \%$. For case 2 the demand cut will be $0.43 \%$ :
b) For the price range 3-5 and case 1 the demand elasticity will cover interval of $-0.44 \%$ to $-2.00 \%$, for case 2 the interval will be $-0.07 \%$ to $-0.20 \%$.
