## Answer on Question \#83945-Economics - Finance

## Question:

1) If a firm borrows $£ 20$ million for one year at an interest rate of $4 \%$, approximately what is the present value of the interest tax shield? Assume a $20 \%$ marginal corporate tax rate.

## Answer

Annual interest tax shield can be calculated by following:
Interest rate payment: $£ 20,000,000 * 0.04=£ 800,000$
Annual tax shield: $0.2^{*} £ 800,000=£ 160,000$
Present value of the interest tax shield:

$$
P V(\text { Tax Shield })=\frac{D R_{D} T_{C}}{R_{D}}=D * T_{C}
$$

where
D - debt;
$\mathrm{T}_{\mathrm{C}}$ - tax rate.

$$
P V=£ 20,000,000 * 0.2=£ 4,000,000
$$

Assume perpetual debt:

$$
P V=\frac{£ 160,000}{0.04}=£ 4,000,000
$$

## Question:

2) What is the standard deviation of the portfolio that consists of $A$ and $B$ shares?

|  | Firm Expected Return | Standard Deviation | Percentage of portfolio | Correlation |
| :---: | :---: | :---: | :---: | :---: |
| A | $20 \%$ | $40 \%$ | $60 \%$ | 0.2 |
| B | $10 \%$ | $20 \%$ | $40 \%$ | 0.2 |

## Answer

$$
\sigma_{\text {portfolio }}=\sqrt{w_{1}^{2} \sigma_{1}^{2}+w_{2}^{2} \sigma_{2}^{2}+2 w_{1} w_{2} \rho_{1,2} \sigma_{1} \sigma_{2}}
$$

where
$\mathrm{w}_{1,2^{-}}$proportion of portfolio invested in shares 1,2;
$\sigma_{1,2-}$ shares 1,2 standard deviation of returns
$\rho_{1,2^{-}}$correlation coefficient

$$
\begin{aligned}
\sigma_{\text {portfolio }}= & \sqrt{(0.6)^{2}(0.4-0.2)^{2}+(0.4)^{2}(0.2-0.1)^{2}+2 * 0.6 * 0.4 * 0.2 *(0.4-0.2) *(0.2-0.1)} \\
& =0.133=13,3 \%
\end{aligned}
$$
