Outdoor Sports is considering adding a miniature golf course to its facility. The course would cost \$138,000, would be depreciated on a straight line basis over its 5-year life, and would have a zero salvage value. The estimated income from the golfing fees would be \$72,000 a year with \$24,000 of that amount being variable cost. The fixed cost would be \$11,600. In addition, the firm anticipates an additional \$14,000 in revenue from its existing facilities if the golf course is added. The project will require \$3,000 of net working capital, which is recoverable at the end of the project. What is the net present value of this project at a discount rate of 12 percent and a tax rate of 34 percent?

\$11,309 \$11,628 \$12,737 \$14,439

\$14,901
