

## Answer on Question #45759, Engineering, Other

### Task:

a) Which of the following functions are 1-1 and which are onto? Justify your answer.

i)  $f : \mathbb{R} \rightarrow \mathbb{R}_0$  given by  $f(x) = x^2$  where  $\mathbb{R}_0$  is the set  $\{x \in \mathbb{R} \mid x \geq 0\}$ .

ii)  $f : \mathbb{R} \rightarrow \mathbb{R}$  given by  $f(x) = x^2 + x + 1$ .

b) Let  $\vec{a} = (1+2p^2; p^3+2p^2; 1+p^2)$

and  $\vec{b} = (1+p^2; 0; 1+p^2)$ .

i) Find the direct cosines of  $\vec{a}$  and  $\vec{b}$ .

ii) Find the angle between  $\vec{a}$  and  $\vec{b}$ .

c) Check that the vectors  $\vec{u} = (35; 45; 0)$   $\vec{v} = (45; 35; 0)$

and  $\vec{w} = (0; 0; 1)$  are orthonormal. Further, write the vector  $\vec{a} = (1; 1; 2)$  as a linear combination of the vectors.

### Solution:

**a)**

The function is injective or 1 to 1 if every element of the function's codomain is the image of at most one element of its domain.

The function  $f$  from a set  $X$  to a set  $Y$  is surjective (or onto), or a surjection, if every element  $y$  in  $Y$  has a corresponding element  $x$  in  $X$  such that  $f(x) = y$ .

i)  $f : \mathbb{R} \rightarrow \mathbb{R}_0$  given by  $f(x) = x^2$

if  $\mathbb{R}_0 = \mathbb{R} \setminus \{0\}$  then  $f$  is not onto because for  $y = -2$  we can't find a  $x$  such that  $f(x) = x^2$  and it is not 1 to 1, because  $f(1) = f(-1) = 1$ . If  $\mathbb{R}_0 = [0; +\infty)$  then  $f$  is onto, because for every  $y$  in  $[0; +\infty)$  exists  $x = \sqrt{y}$  such that  $y=f(x)$  and it is not 1 to 1, because  $f(-1)=f(1)$ .

ii)  $f : \mathbb{R} \rightarrow \mathbb{R}$  given by  $f(x) = x^2 + x + 1$ .

This function is not onto, because for  $y = 0$  we can't find  $x$  such that  $0 = x^2 + x + 1$ . And it is not 1 to 1 because  $f(1) = f(-2) = 3$ .

ii)  $f : \mathbb{R} \rightarrow \mathbb{R}$  given by  $f(x) = x^2 + x + 1$ .  
This function is not onto, because for  $y = 0$  we can't find  $x$  such that  $0 = x^2 + x + 1$ . And it is not 1 to 1 because  $f(1) = f(-2) = 3$ .

**b) Let  $\vec{a} = (1+2p^2; p^3+2p^2; 1+p^2)$**

**and  $\vec{b} = (1+p^2; 0; 1+p^2)$ .**

**i) Find the direct cosines of  $\vec{a}$  and  $\vec{b}$ .**

**ii) Find the angle between  $\vec{a}$  and  $\vec{b}$ .**

$$\cos \angle(\vec{a}, \vec{b}) = \frac{\vec{a} \cdot \vec{b}}{|\vec{a}| \cdot |\vec{b}|} = \frac{(1+p^2)(1+2p^2) + 0(p^3+2p^2) + (1+p^2)^2}{\sqrt{(1+p^2)^2 + (1+p^2)^2} \sqrt{(1+2p^2)^2 + (p^3+2p^2)^2 + (1+p^2)^2}} =$$

$$= \frac{3p^4 + 5p^2 + 2}{(1+p^2)\sqrt{2}\sqrt{p^6 + 4p^5 + 9p^4 + 6p^2 + 2}} \Rightarrow$$

$$\angle(\vec{a}, \vec{b}) = \arccos\left(\frac{3p^4 + 5p^2 + 2}{(1+p^2)\sqrt{2}\sqrt{p^6 + 4p^5 + 9p^4 + 6p^2 + 2}}\right)$$

c) Check that the vectors  $\bar{u} = (35;45;0)$   $\bar{v} = (45;35;0)$  and  $\bar{w} = (0;0;1)$  are orthonormal. Further, write the vector  $\mathbf{a} = (1; 1; 2)$  as a linear combination of the vectors.

$\bar{u} = (35;45;0)$   $\bar{v} = (45;35;0)$  and  $\bar{w} = (0;0;1)$  are orthonormal if  $\bar{u} \cdot \bar{v} \cdot \bar{w} = 0$   
 so  $\bar{u} \cdot \bar{v} \cdot \bar{w} = 35 * 45 * 0 + 45 * 35 * 0 + 0 * 0 * 1 = 0$  they are orthonormal.

Further, write the vector  $\mathbf{a} = (1; 1; 2)$  as a linear combination of the vectors

$\bar{u} = (35;45;0)$   $\bar{v} = (45;35;0)$  and  $\bar{w} = (0;0;1)$

$$\bar{a} = x\bar{u} + y\bar{v} + z\bar{w}$$

$$(1;1;2) = x(35;45;0) + y(45;35;0) + z(0;0;1)$$

$$(1;1;2) = (35x + 45y; 45x + 35y; z)$$

$$\begin{cases} 35x + 45y = 1 \\ 45x + 35y = 1 \\ z = 2 \end{cases}$$

$$\begin{cases} x = \frac{1}{80} \\ y = \frac{1}{80} \\ z = 2 \end{cases}$$

So linear combination of the vectors is  $(1/80; 1/80; 2)$
