## Conditions

the attendance at college of a group of 18 students was recorded for a 4 week period. the numbers of students actually attending each of 16 classes are shown below.

18,16,18,15,18,17,14,17,17,16,17,18,17,18,18,16.calculate the mean and standard deviation of students attending the classes.

EXPRESS THE MEAN AS A PERCENTAGE OF THE 18 STUDENTS IN THE GROUP.

## Solution

For calculating the mean we must use the formula of expectation for a discrete random value:
$M(X)=\frac{1}{n} \sum_{i=1}^{n} x_{i}$
where $\mathrm{n}=16, x_{i}$ - the number of students actually attending each of $\mathrm{n}=16$ classes from 1 st to 16th.
$M(X)=\frac{1}{16}(18+16+18+15+18+17+14+17+17+16+17+18+17+18+$ $18+16)=16,875$

To find a standard deviation we must use the formula below:
$\sigma=\sqrt{\frac{1}{n} \sum_{i=1}^{n}\left(x_{i}-M(X)\right)^{2}}$
These calculations are comfortably to do in Excel (here is a table):

| $i$ | $x_{i}$ | $M(X)$ | $x_{i}-M(X)$ | $\left(x_{i}-M(X)\right)^{2}$ | $\sigma$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 18 | 16,875 | 1,125 | 1,265625 | 1,165922382 |
| 2 | 16 |  | -0,875 | 0,765625 |  |
| 3 | 18 |  | 1,125 | 1,265625 |  |
| 4 | 15 |  | -1,875 | 3,515625 |  |
| 5 | 18 |  | 1,125 | 1,265625 |  |
| 6 | 17 |  | 0,125 | 0,015625 |  |
| 7 | 14 |  | -2,875 | 8,265625 |  |
| 8 | 17 |  | 0,125 | 0,015625 |  |
| 9 | 17 |  | 0,125 | 0,015625 |  |
| 10 | 16 |  | -0,875 | 0,765625 |  |
| 11 | 17 |  | 0,125 | 0,015625 |  |
| 12 | 18 |  | 1,125 | 1,265625 |  |
| 13 | 17 |  | 0,125 | 0,015625 |  |
| 14 | 18 |  | 1,125 | 1,265625 |  |

| 15 | 18 |  |  |
| :--- | :--- | :--- | :--- |
| 16 | 16 | 1,125 | 1,265625 |
|  | $-0,875$ | 0,765625 |  |

The standard deviation is 1,165922382 . And this is $\frac{1,165922382}{18} \cdot 100 \% \approx 6,477347 \%$ of all group.

## Answer:

The mean is $M(X)=16,875$

The standard deviation is $\sigma=1,165922382=6,477347 \%$
