

We know the formula:

$$\frac{\text{concentration } (\%)}{100\%} \cdot \text{Volume } (\text{mL}) = \text{Dosage } (\text{gram}) \Rightarrow$$

$$\Rightarrow \text{Volume}(\text{mL}) = \frac{100\% \cdot \text{Dosage } (\text{gram})}{\text{concentration } (\%)}$$

So, we will have:

$$\begin{cases} \text{concentration } (\%) = 1\% \\ \text{Dosage } (\text{gram}) = 20 \text{ grams} \end{cases} \Rightarrow$$

$$\Rightarrow \text{Volume}(\text{mL}) = \frac{100\% \cdot 20 \text{ grams}}{1\%} = 2000 \text{ mL} = 2 \text{ L.}$$

Answer: 2 liters.
