

Gravel is being dumped from a conveyor belt at a rate of 30 cubic feet per minute. It forms a pile in the shape of a right circular cone whose base **diameter and height are always the same**. How fast is the height of the pile increasing when the pile is 10 feet high? Recall that the volume of a right circular cone with height  $h$  and radius of the base  $r$  is given by  $V=1/3 \pi r^2 h$ .

The volume of a right circular cone with height  $h$  and radius of the base  $r$  is given by  $V=1/3 \pi r^2 h$ .

**“diameter and height are always the same”**, then  $h=d \rightarrow d=2r \rightarrow r=h/d$ .

$h=10$ ;  $r=5$ ;

$$V=1/3 \pi r^2 h \rightarrow V=1/3 \pi (5^2) * 10 = 261.66$$

The average velocity  $v$  of an object moving through a displacement  $\Delta s$  during a time interval  $\Delta t$  is described by the formula:

$$U=\Delta s/\Delta t \rightarrow s=v;$$

**30 – 1 minute ,**

**261.66 – x minutes**

$$X=(261.66*1)/30=8,722 \text{ (minutes).}$$
