

The Friday price is $P_{\text{friday}} = (1 - 0.40) \cdot P_{\text{regular}} = 0.60 \cdot \$22 = \$13.2$.

The Saturday price is $P_{\text{saturday}} = (1 - 0.65) \cdot P_{\text{regular}} = 0.35 \cdot \$22 = \$7.7$.

So, he could save $\Delta P = P_{\text{friday}} - P_{\text{saturday}} = \$13.2 - \$7.7 = \5.5 .

Answer: \$5.5.
