

Show that  $f(x)=x^2$  is not uniformly continuous on  $R$ .

**Solution.**

Function  $f(x)$  is uniformly continuous on  $R$  if for arbitrary  $\varepsilon > 0$  there exists  $\delta > 0$  such that as soon as  $|x - x_0| < \delta$  it follows that  $|f(x) - f(x_0)| < \varepsilon$  for any  $x_0 \in R$ .

Note that the value of  $\delta$  doesn't depend upon the choice of  $x_0$ .

Now suppose that  $\varepsilon > 0$  is given and let us try to find corresponding value of  $\delta$ .

Using Lagrange theorem we can write that

$$|f(x) - f(x_0)| = |f'(c)| * |x - x_0| = |2c| |x - x_0|,$$

where  $c \in [x_0, x]$ .

Let  $|x - x_0| < \delta$  and in order to find the value of  $\delta$  we demand that

$$|2c| |x - x_0| < |2c| \delta = \varepsilon.$$

From this  $\delta = \varepsilon / |2c|$ . But as the value of  $c$  depends on  $x_0$  then the value of  $\delta$  depends on the choice of  $x_0$  too. So the value of  $\delta$  which is common for all points  $x_0 \in R$  doesn't exist.

Therefore the function  $f(x) = x^2$  is not uniformly continuous on  $R$ . Q.E.D.
