

What is 65% as a fraction in lowest term?

A percentage is a number or ratio as a fraction of 100. Therefore:

$$65\% = \frac{65}{100}$$

To reduce fractions to the lowest terms, you must find the highest number that will divide into both the numerator and the denominator. Divide both the numerator by the same number and the result will be a fraction reduced to its lowest terms. In our case:

$$65 = 5 * 13 \quad \text{and} \quad 100 = 20 * 5$$

$$\frac{65}{100} = \frac{5*13}{20*5} = \frac{13}{20}$$

Answer: $\frac{13}{20}$
