

Prove the second absorption law from Table 1 by showing that if  $A$  and  $B$  are sets, then  $A \cap (A \cup B) = A$ .

**Proof:**

Often, objects of a similar nature or with a common property are collected into sets. Each member is called an element of the set. There should be only one of each member (all members are unique).  $A$  is a set, and  $a$  is an element in  $A$ . Same with  $B$  and  $b$ . When we say an element  $a$  is in a set  $A$ , we use the symbol  $\in$  to show it. Two sets can be "added" together. The union of  $A$  and  $B$ , denoted by  $A \cup B$ , is the set of all things that are members of either  $A$  or  $B$ . The union  $A \cup B$  of  $A$  and  $B$  is defined by:  $A \cup B = \{x : x \in A \text{ or } x \in B\}$ .

A new set can also be constructed by determining which members two sets have "in common". The intersection of  $A$  and  $B$ , denoted by  $A \cap B$ , is the set of all things that are members of both  $A$  and  $B$ . If  $A \cap B = \emptyset$ , then  $A$  and  $B$  are called disjoint. The intersection  $A \cap B$  of  $A$  and  $B$  is defined by:  $A \cap B = \{x : x \in A \text{ and } x \in B\}$ .

When we define a set, if we take pieces of that set, we can form what is called a subset.  $A$  is a subset of  $B$  if and only if every element of  $A$  is in  $B$ .

$A \cap (A \cup B)$  is a subset of  $A$ ,  $x$  is an element in  $A \cap (A \cup B)$ , also  $x$  is an element in  $A$  by definition of intersection. Accordingly  $A \cap (A \cup B)$  is a subset of  $A$ . Another we can write:

$$\begin{aligned}x \in A \cap (A \cup B) &\leftrightarrow x \in A \text{ and } x \in A \cup B \\ &\leftrightarrow x \in A \text{ and } [x \in A \text{ or } x \in B] \\ &\leftrightarrow x \in A\end{aligned}$$

and so  $A \cap (A \cup B) = A$
