## Answer on Question \#37581-<Math> - <Geometry>

Given 3 points, can one construct a hyperbolic curve thru them using classical geometry of straight edge and compass.

## Solution:

Equation of the hyperbolic curve:

$$
\begin{equation*}
y=\frac{k}{x^{n}+b} \tag{1}
\end{equation*}
$$

If we have three points on the hyperbolic curve ( $\left.A\left(x_{1}, y_{1}\right) ; B\left(x_{2}, y_{2}\right) ; C\left(x_{3}, y_{3}\right)\right)$, we can substitute the value of $X$ and $Y$ of every point in the equation (1) and we will have three equations with three unknowns: $k, n, b$. If we will solve the equation and find the unknown variables, it is possible to construct the hyperbolic curve using the equation (1) using known variables $\mathrm{k}, \mathrm{n}, \mathrm{b}$.
Answer: it is possible to construct hyperbolic curve through 3 given points.
