

### Answer on Question #40758 – Math – Vector Calculus

Explain why it is not possible for two of a vector's direction angles to be less than 45°.

**Solution.**

As it is known, there is a theorem for vector's direction angles, which states that  $\cos^2 \alpha_x + \cos^2 \alpha_y + \cos^2 \alpha_z = 1$ .

This statement can be easily derived, if one substitutes  $\frac{a_x}{|\vec{a}|}$  for  $\alpha_x$  and so on for other angles:

$$\cos^2 \alpha_x + \cos^2 \alpha_y + \cos^2 \alpha_z = \frac{a_x^2}{|\vec{a}|^2} + \frac{a_y^2}{|\vec{a}|^2} + \frac{a_z^2}{|\vec{a}|^2} = \frac{a_x^2 + a_y^2 + a_z^2}{|\vec{a}|^2} = \frac{|\vec{a}|^2}{|\vec{a}|^2} \equiv 1.$$

If two of a vector's direction angles (for e.g.,  $\alpha_x$  and  $\alpha_y$ ) are less than 45°, then

$$\cos^2 \alpha_x + \cos^2 \alpha_y + \cos^2 \alpha_z > \cos^2 45^\circ + \cos^2 45^\circ + \cos^2 \alpha_z = \frac{1}{2} + \frac{1}{2} + \cos^2 \alpha_z \geq 1.$$

We obtained that  $\cos^2 \alpha_x + \cos^2 \alpha_y + \cos^2 \alpha_z > 1$ , and this inequality contradicts with the initial theorem.

**Answer:** the statement is correct.
