

### Answer on Question #42285-Math-Real Analysis

Let  $S \subseteq \mathbb{R}$  be non-empty. Prove that if a number  $u$  in  $\mathbb{R}$  has the properties (i) for every  $n \in \mathbb{N}$  the number  $u - 1/n$  is not an upper bound of  $S$ , and (ii) for every number  $n \in \mathbb{N}$  the number  $u + 1/n$  is upper bound  $S$ , then

$u = \sup S$ .

#### Solution

1) Let's prove the first part.

Assume that there is some  $n \in \mathbb{N}$  such that  $(u - \frac{1}{n})$  is an upper bound of  $S$ .

By the definition supremum is the lowest upper bound. But easy to see that  $(u - \frac{1}{n}) < u$  and thus  $u$  isn't the lowest bound.

So it's not true that there is some  $n \in \mathbb{N}$  such that  $(u - \frac{1}{n})$  is an upper bound of  $S$ .

It means that for every number  $n \in \mathbb{N}$  the number  $(u - \frac{1}{n})$  is not an upper bound of  $S$ .

2) Let's prove the second part.

For any  $x \in S$  it's true that  $x \leq u$ , because  $u = \sup S$ .

At the same time for any  $n \in \mathbb{N}$  it's true that  $u < u + \frac{1}{n}$ .

So we have for any  $x \in S$ :  $x \leq u < u + \frac{1}{n}$ . From the transitivity of real numbers  $x < u + \frac{1}{n}$ .

Thus for any  $n \in \mathbb{N}$   $(u + \frac{1}{n})$  is greater than any element of  $S$ , which means that  $(u + \frac{1}{n})$  is an upper bound.
