

Answer on Question #56855 – Math – Algorithms | Quantitative Methods

For the given functions $f(x)$, let $x_0 = 0$, $x_1 = 0.6$, and $x_2 = 0.9$. Construct interpolation polynomials of degree at most one and at most two to approximate $f(0.45)$, and find the absolute error.

a. $f(x) = \cos x$

Solution

$$y_0 = f(x_0) = \cos 0 = 1;$$

$$y_1 = f(x_1) = \cos 0.6 = 0.8253;$$

$$y_2 = f(x_2) = \cos 0.9 = 0.6216;$$

a) The Lagrange interpolation polynomial of degree at most 1 is constructed as follows:

$$L_1(x) = \begin{cases} \frac{x_1 - x}{x_1 - x_0}y_0 + \frac{x - x_0}{x_1 - x_0}y_1, & \text{for } x \in [x_0, x_1], \\ \frac{x_2 - x}{x_2 - x_1}y_1 + \frac{x - x_1}{x_2 - x_1}y_2, & \text{for } x \in [x_1, x_2], \end{cases}$$

$$L_1(x) = \begin{cases} 1 - 0.2912x, & \text{for } x \in [0, 0.6], \\ 1.2327 - 0.679x, & \text{for } x \in [0.6, 0.9], \end{cases}$$

$f(0.45) \approx 0.8690$ is approximated through the linear Lagrange polynomial: $f(0.45) = \cos 0.45 = 0.9004$.

The absolute error is

$$|0.9004 - 0.8690| = 0.0314.$$

b) The Lagrange interpolation polynomial of degree at most 2 is constructed as follows:

$$L_2(x) = l_0(x)y_0 + l_1(x)y_1 + l_2(x)y_2,$$

where

$$l_0(x) = \left(\frac{x - x_1}{x_0 - x_1}\right)\left(\frac{x - x_2}{x_0 - x_2}\right)$$

$$l_1(x) = \left(\frac{x - x_0}{x_1 - x_0}\right)\left(\frac{x - x_2}{x_1 - x_2}\right)$$

$$l_2(x) = \left(\frac{x - x_0}{x_2 - x_0}\right)\left(\frac{x - x_1}{x_2 - x_1}\right)$$

$f(0.45) \approx 0.8980$ is approximated through the quadratic Lagrange polynomial.

The absolute error is

$$|0.9004 - 0.8980| = 0.0024.$$
