## Answer on Question \#66355 - Math - Statistics and Probability

Question
Work out the Spearman's rank correlation.

| Student | Q.T. | M.A. |
| :--- | :--- | :--- |
| A | 2 | 3 |
| B | 7 | 6 |
| C | 6 | 4 |
| D | 1 | 2 |
| E | 4 | 5 |
| F | 3 | 1 |
| G | 5 | 8 |
| H | 8 | 7 |

## Solution

Since all the data in columns consists of distinct integers, we can compute Spearman's rank correlation coefficient using the following formula:

$$
\rho=1-\frac{6 \sum_{i=1}^{n} d_{i}^{2}}{n\left(n^{2}-1\right)^{2}},
$$

where $d_{i}=r g\left(x_{i}\right)-r g\left(y_{i}\right)$ is the difference between two ranks (measure of order) of each observation, $n$ is number of observations. In our case ranks coincide with observations, so we'll just sort data by Q.T. for clarity. Then we compute $d$ and $d^{2}$.

| Student | Q.T. $=r g(x)$ | M.A. $=r g(y)$ | $d$ | $d^{2}$ |
| :--- | :--- | :--- | :--- | :--- |
| D | 1 | 2 | -1 | 1 |
| A | 2 | 3 | -1 | 1 |
| F | 3 | 1 | 2 | 4 |
| E | 4 | 5 | -1 | 1 |
| G | 5 | 8 | -3 | 9 |
| C | 6 | 4 | 2 | 4 |
| B | 7 | 6 | 1 | 1 |
| H | 8 | 7 | 1 | 1 |

Finally, we substitute obtained values into the formula:

$$
\rho=1-\frac{6(1+1+4+1+9+4+1+1)}{8\left(8^{2}-1\right)}=\frac{31}{42} \approx 0.7381
$$

Answer: $\rho=\frac{31}{42} \approx 0.7381$.
