

Answer on Question #70526, Math / Calculus

Consider the given vector equation.

$$\mathbf{r}(t) = 4e^t \mathbf{i} + 5e^{-t} \mathbf{j}$$

(a) Find $\mathbf{r}'(t)$.

(b) Sketch the plane curve together with the position vector $\mathbf{r}(t)$ and the tangent vector $\mathbf{r}'(t)$ for the given value of $t = 0$.

Solution:

$$\mathbf{r}(t) = 4e^t \mathbf{i} + 5e^{-t} \mathbf{j}$$

$$\mathbf{r}'(t) = 4e^t \mathbf{i} - 5e^{-t} \mathbf{j}$$

For the given value of $t = 0$

the position vector

$$\mathbf{r}(0) = 4\mathbf{i} + 5\mathbf{j}$$

the tangent vector

$$\mathbf{r}'(0) = 4\mathbf{i} - 5\mathbf{j}$$
