

## Answer on Question#70601 – Math – Calculus

**Question.**  $\varphi(n) = n - 1 \forall n \in \mathbb{N}$ , where  $\varphi$  is the Euler-phi function. Is this statement true? Justify your answer.

**Solution.** By the definition of the Euler-phi function

(see [https://en.wikipedia.org/wiki/Euler%27s\\_totient\\_function](https://en.wikipedia.org/wiki/Euler%27s_totient_function)) it counts the positive integers up to a given integer  $n$  that are relatively prime to  $n$ .

Let us put  $n = 9$ . Then there are six positive integers up to 9 that are relatively prime to 9:

1, 2, 4, 5, 7, 8. (see [https://en.wikipedia.org/wiki/Euler%27s\\_totient\\_function](https://en.wikipedia.org/wiki/Euler%27s_totient_function)). Then we conclude that  $\varphi(9) = 6 \neq 8 = 9 - 1$ . We provided counterexample, so generally speaking  $\varphi(n) \neq n - 1$ . The statement is false.

**Answer.** The statement is false.
