## Answer on Question \#73657 - Math - Calculus

## Question

A jogger runs from her home to a point A, which is 6 km away. For there 6 km , she begins by running at a constant speed till she reaches a hilly portion 2 km from her home. Here her speed slows down while she runs up the hill, which is a 1-km run. Then she speeds up while running down the hill. The last 2 km of the run are again at constant speed. Draw a graph to show the jogger's speed as a function of the distance from her home. Also find the range of this function.

## Solution

The graph of the jogger's speed is shown on the Figure 1.

FIGURE 1
As we can see the initial jogger's speed is $v_{1}$ is constant for the first 2 km of the distance. The next 1 km the speed decreases to its minimal value $v_{\text {min }}$. Then the speed increases up to $v_{2}$ and stay constant for the last 2 km of distance. Suppose that $v_{2}$ is less that $v_{1}$.

The Figure 1 shows that the values of jogger's speed function are between $v_{\text {min }}$ and $v_{1}$. So, the range of this function is $\left[v_{\min }, v_{1}\right]$.
