## Answer on Question \#74840 - Math - Linear Algebra

## Question

Which of the following statement are True: if a matrix has $\mathrm{n}^{\wedge} 2$ entries, where n belongs to N , then it is a square matrix.

## Solution

If a matrix has $\mathrm{n}^{\wedge} 2$ entries, where n belongs to N , then it does not always mean that the matrix is square. For example, if $n=6$, then a matrix may have the sizes $(6 \times 6),(4 \times 9)$ or ( $9 \times 4$ ). Therefore, this statement is false in general.

Answer: false.
