

## Answer on Question #76994 – Math – Linear Algebra

### Question

$$x = u + t_1v + t_2w$$

What conditions on the vectors  $u, v, w \in \mathbb{R}^3$ , would create an object that is not a plane?

### Solution

The expression  $x = u + t_1v + t_2w$  sets a plane in  $\mathbb{R}^3$  only if: 1)  $u$  is the radius-vector of a point; 2)  $v, w$  are (nonzero) linear independent (not collinear) vectors.

If  $u$  is the radius-vector of some point, then  $x = u + t_1v + t_2w$  is not plane only if vectors  $v$  and  $w$  are linearly dependent ( $v$  and  $w$  are collinear).

Vectors  $v, w \in \mathbb{R}^3$  must be linearly dependent. It means that  $\exists a_1, a_2 \in \mathbb{R} (a_1 \neq 0 \text{ or } a_2 \neq 0): a_1v + a_2w = 0$ .
