## Answer on Question \#79192 - Math - Differential Equations:

Question: Let $A$ be a constant. Find the general solution of $y^{\prime}-A y=0$.
(a). $y=c e^{A x}$
(b). $\mathrm{y}=-\mathrm{c} e^{A x}$
(c). $\mathrm{y}=e^{A x}$
(d). $\mathrm{y}=-e^{A x}$

Solution: Differential equation is given by

$$
\begin{align*}
& \mathrm{y}^{\prime}-\mathrm{A} y=0, \\
& \text { or } \frac{\mathrm{dy}}{\mathrm{dx}}-\mathrm{Ay}=0, \quad\left[\text { As } \mathrm{y}^{\prime}=\frac{d y}{d x}\right] \\
& \text { or } \frac{1}{\mathrm{y}} \frac{\mathrm{dy}}{\mathrm{dx}}=\mathrm{A}, \\
& \text { or } \frac{1}{y} \mathrm{dy}=\mathrm{Adx} \quad \text {......................(1) } \tag{1}
\end{align*}
$$

Now integrating both sides of equation (1) and we get

$$
\begin{aligned}
& \ln (y)=A x+\ln (c), \quad \text { [where } \ln c \text { is integration constant; }] \\
& \text { or } \ln \left(\frac{y}{c}\right)=A x, \\
& \text { or } \frac{y}{c}=e^{A x}, \\
& \text { or } y=c e^{A x} .
\end{aligned}
$$

Answer: option (a) is correct.
