## Answer on Question #83760 – Math – Discrete Mathematics Question

How many 8-bits sequences that start with the same two bits or their fourth and fifth bits are equal or end with the same two bits are there?

## Solution

The total number of 8-bit sequences is  $2^8 = 256$ .

Denote  $N_1$  the number of sequences with the stated property. We have

$$N_1 = 256 - N_2$$

where  $N_2$  is the number of 8-bit sequences with all different pairs:  $1^{st}$  and  $2^{nd}$  different bits, and  $4^{th}$  and  $5^{th}$  different bits, and  $7^{th}$  and  $8^{th}$  different bits.

Calculate  $N_2$ .

There are 2 ways to choose the  $1^{st}$  bit, after that the  $2^{nd}$  bit is defined automatically – it is opposite to the  $1^{st}$ . There are 2 ways to choose the  $3^{rd}$  bit, 2 ways to choose the  $4^{th}$  bit –  $5^{th}$  is defined automatically, 2 ways to choose the  $6^{th}$  bit, 2 ways to choose the  $7^{th}$  bit –  $8^{th}$  is defined automatically.

So totally there are  $2 \cdot 2 \cdot 2 \cdot 2 \cdot 2 = 32$  ways,  $N_2 = 32$ .

Then  $N_1 = 256 - N_2 = 224$ .

Answer: 224.
