## Answer on Question \#85004 - Math - Statistics and Probability

## Question

If the correlation between X and Y is -0.73 .Then what is the correlation between X +5 and $\mathrm{Y}-4$ ?

## Solution

From definition $\operatorname{corr}(X, Y)=\frac{\operatorname{cov}(X, Y)}{\sigma_{X} \sigma_{Y}}=-0.73$, where $\operatorname{cov}(X, Y)=E[(X-$ $E[X])(Y-E[Y])]$ is the covariance of X and $\mathrm{Y}, \sigma_{X}=\operatorname{cov}(X, X) \quad \sigma_{Y}=\operatorname{cov}(Y, Y)$, and $E[X]$ is expected X value.

From covariance properties, $\operatorname{cov}(X+a, Y+b)=\operatorname{cov}(X, Y)$, where $\mathrm{a}, \mathrm{b}$ are constant values.

So, $\sigma_{X+5}=\operatorname{cov}(X+5, X+5)=\operatorname{cov}(X, X)=\sigma_{X}, \sigma_{Y-4}=\operatorname{cov}(Y-4, Y-4)=$ $\operatorname{cov}(Y, Y)=\sigma_{Y}$,
$\operatorname{cov}(X+5, Y-4)=\operatorname{cov}(X, Y)$.
Thus $\operatorname{corr}(X+5, Y-4)=\frac{\operatorname{cov}(X+5, Y-4)}{\sigma_{X+5} \sigma_{Y-4}}=\frac{\operatorname{cov}(X, Y)}{\sigma_{X} \sigma_{Y}}=-0.73$

Answer: the correlation between $\mathrm{X}+5$ and $\mathrm{Y}-4$ is equal to -0.73 .
