

Question#23227

Suppose you have a rectangular wooden block with dimensions 8.0 cm x 8.0 cm x 9.0 cm that has a density of  $0.85 \times 10^3 \text{ kg/m}^3$ . The block has a cylindrical hole inside it so that a lead cylinder 5.0 cm in diameter and 7.5 cm high can be fitted completely inside. What is the volume of the lead cylinder that fits inside (in  $\text{m}^3$ )? What is the mass of the lead cylinder if the density of lead is  $1.13 \times 10^4$ ? (Density  $\text{kg/m}^3$ )? What is the volume of the wood in the wooden block (excluding the volume of the cylindrical hole)?

Solution:

Let:

$$L = 8 \text{ cm} = 0.08 \text{ m}$$

$$B = 8 \text{ cm} = 0.08 \text{ m}$$

$$H = 9 \text{ cm} = 0.09 \text{ m}$$

$$D = 5 \text{ cm} = 0.05 \text{ m}$$

$$h = 7.5 \text{ cm} = 0.075 \text{ m}$$

$$\rho_{\text{lead}} = 1.13 \times 10^4 \text{ kg/m}^3$$

---

$$m_{\text{lead}} = ?$$

$$V_{\text{wood}} = ?$$

The mass of lead is:

$$m = \rho_{\text{lead}} * V_{\text{lead}}, \text{ where } V_{\text{lead}} \text{ is the volume of the lead cylinder}$$

$$V_{\text{lead}} = \frac{1}{4} \pi D^2 h$$

$$V_{\text{lead}} = \frac{1}{4} 3.142 * 0.05^2 * 0.075 = 0.000147 \text{ m}^3$$

$$m = 11300 * 0.000147 = 1.664 \text{ kg}$$

The volume of the wood is:

$$V_{\text{wood}} = V - V_{\text{lead}}, \text{ where } V \text{ is the volume of the rectangular block}$$

$$V = L * B * H$$

$$V_{\text{wood}} = L * B * H - V_{\text{lead}}$$

$$V_{\text{wood}} = 0.08 * 0.08 * 0.09 - 0.000147 = 0.000429 \text{ m}^3$$

**Answer:**

**The mass of lead is 1.664 kg, the volume of wood is  $0.000429 \text{ m}^3$  ( $429 \text{ cm}^3$ ).**
