

A car moving with a velocity of 36 km/h is brought to rest in 5 seconds. Calculate its deceleration?

**Solution.**

$$v_i = 36 \frac{\text{km}}{\text{h}}, t = 5\text{s};$$

$$a - ?$$

A velocity of the car:

$$v = v_i - at.$$

$v_i$  – the initial velocity;

$v$  – the final velocity;

$a$  – the deceleration;

$t$  – the time.

Converting the initial velocity to meters per hour:

$$v_i = 36 \frac{\text{km}}{\text{hour}} \left( \frac{1000\text{m}}{1\text{km}} \right) = 36000 \frac{\text{m}}{\text{hour}}.$$

Converting the initial velocity to meters per second:

$$v_i = 36000 \frac{\text{km}}{\text{hour}} \left( \frac{1\text{hour}}{3600\text{second}} \right) = 10 \frac{\text{m}}{\text{second}}.$$

$$v_i = 10 \frac{\text{m}}{\text{s}}.$$

A car is brought to rest then:

$$v = 0.$$

$$0 = v_i - at;$$

$$v_i = at;$$

$$a = \frac{v_i}{t}.$$

A deceleration is:

$$a = \frac{10 \frac{\text{m}}{\text{s}}}{5\text{s}} = 2 \frac{\text{m}}{\text{s}^2}.$$

**Answer:** A deceleration is  $a = 2 \frac{\text{m}}{\text{s}^2}$ .
