Task. A ball is thrown downward $v=8 \mathrm{~m} / \mathrm{s}$. What is its speed 4 seconds later?
Solution. Notice that there is a gravitation force acting on the ball, so it moves with constant acceleration $g=9.8 \mathrm{~m} / \mathrm{s}^{2}$. Therefore the speed of the ball after $t$ seconds is given by the formula:

$$
v(t)=v_{0}+g t,
$$

where $v_{0}=8 \mathrm{~m} / \mathrm{s}$ is the initial velocity.
We should compute $v(4 s)$. Substituting values we get:

$$
v(4)=v_{0}+g t=8+9.8 * 4=47.2 \mathrm{~m} / \mathrm{s} .
$$

Answer. $v=47.2 \mathrm{~m} / \mathrm{s}$.
