a bullet strikes a plank of thickness 5 cm with velocity $1000 \mathrm{~m} / \mathrm{s}$ and emerges out with velocity of $400 \mathrm{~m} / \mathrm{s}$. Calculate the average retardation of bullet.

Acceleration is defined as the rate of change of velocity with respect to time, in a given direction. If we write the definition for acceleration in mathematical terms we obtain:

$$
a=\frac{v-u}{t}
$$

$v$ - initial velocity, $u$ - final velocity.
Distance equals:

$$
s=\frac{v+u}{2} t
$$

If we now combine the two equations that we have derived, we can create another equation:

$$
s=\frac{v^{2}-u^{2}}{2 a}
$$

Therefore, retardation of bullet equals:

$$
a=\frac{v^{2}-u^{2}}{2 s}=\frac{1000^{2}-400^{2}}{2 * 0.05}=8400000 \frac{\mathrm{~m}}{\mathrm{~s}^{2}}
$$

Answer: $8400000 \frac{\mathrm{~m}}{\mathrm{~s}^{2}}$
