Task. An object is moving up an inclined plane. Its velocity changes from $v_{0}=15 \mathrm{~m} / \mathrm{s}$ to $v_{1}=10 \mathrm{~m} / \mathrm{s}$ in $t=2$ seconds. What is its acceleration?

Solution. Assume that the plane moved with constant acceleration $a$. Then $a$ can be expressed via $v_{0}, v_{1}$ and $t$ by the following formula:

$$
a=\frac{v_{1}-v_{0}}{t} .
$$

Substituting values we get:

$$
a=\frac{v_{1}-v_{0}}{t}=\frac{10-15}{2}=-2.5 \mathrm{~m} / \mathrm{s}^{2} .
$$

The negative sign means that the velocity decreases during the motion.
Answer. $a=2.5 \mathrm{~m} / \mathrm{s}^{2}$.
