A force does +180 J of work when it acts on a moving object and its direction is in the same direction as the object's displacement. How much work does this force do when the angle between it and the object's displacement is $56^{\circ}$ ?

## Solution.

$$
\begin{gathered}
W_{1}=180 J, \theta=56^{\circ} ; \\
W_{2}-?
\end{gathered}
$$

A force $F$ does of work $W_{1}$ when it acts on a moving object and its direction is in the same direction as the object's displacement $d$ :

$$
W_{1}=F d .
$$

The work $W_{2}$ is:

$$
W_{2}=F d \cos \theta ;
$$

$\theta$ - the angle between the force vector and the direction of the object's displacement.

By these both equations the work $W_{2}$ is:

$$
\begin{gathered}
W_{2}=W_{1} \cos \theta \\
W_{2}=180 \mathrm{~J} \cdot \cos 56^{\circ} \approx 101 \mathrm{~J}
\end{gathered}
$$

Answer: When the angle between it and the object's displacement is $56^{\circ}$, this force does the work $W_{2}=101 \mathrm{~J}$.
