

Answer on Question #37652 - Physics - Other

A glass tube has several different cross-sectional areas with the values indicated in the figure. A piston at the left end of the tube exerts pressure so that mercury within the tube flows from the right end with a speed of 8.0 m/s. Three points within the tube are labeled A, B, and C.

Notes: The drawing is not drawn to scale.

Atmospheric pressure is $1.01 \times 10^5 \text{ N/m}^2$; and the density of mercury is $13\,600 \text{ kg/m}^3$.

What is the total pressure at point B?

Solution:

First, let's find speed at which mercury flowing past point B:

$$S_c V_c = S_B V_B$$

$$V_B = \left(\frac{S_c}{S_B}\right) V_c = \left(\frac{6.0 \text{ cm}^2}{5.6 \text{ cm}^2}\right) \cdot 8 \frac{\text{m}}{\text{s}} = 8.6 \frac{\text{m}}{\text{s}}$$

Now, let's find the total pressure at point B (pressure equation):

$$\frac{1}{2} \rho V_B^2 + p_B = \frac{1}{2} \rho V_C^2 + p_C \quad (1)$$

$$p_C = p_{\text{atm}} = 1.01 \times 10^5 \frac{\text{N}}{\text{m}^2} \quad (2)$$

(2)in(1):

$$\begin{aligned} p_B &= \frac{1}{2} \rho (V_C^2 - V_B^2) + p_{\text{atm}} = 1.01 \times 10^5 \frac{\text{N}}{\text{m}^2} + \frac{1}{2} \cdot 13600 \frac{\text{kg}}{\text{m}^3} \cdot \left(\left(8 \frac{\text{m}}{\text{s}}\right)^2 - \left(8.6 \frac{\text{m}}{\text{s}}\right)^2 \right) \\ &= 3.1 \times 10^4 \text{ Pa} \end{aligned}$$

Answer: total pressure at point B is $3.1 \times 10^4 \text{ Pa}$.
