## Answer on Question\#38506 - Physics - Other

FIU is located roughly at $25^{\circ} 45^{\prime} 9^{\prime \prime} \mathrm{N}, 80^{\circ} 22^{\prime} 40^{\prime \prime} \mathrm{W}$. How many nautical miles is FIU from the equator?

## Solution:

$\mathrm{R}=6300 \mathrm{~km}$ - radius of Earth;
On the sphere the normal passes through the centre and the latitude $(\varphi)$ is therefore equal to the angle subtended at the centre by the meridian arc from the equator to the point concerned. If the meridian distance is denoted by $\mathrm{m}(\varphi)$ then the distance from equator to FIU (equation for the length of the sector; $\alpha-$ angle in radians):

$$
\mathrm{D}=\alpha \mathrm{R}=\pi \cdot \frac{\varphi}{180^{\circ}} \cdot \mathrm{R}=\pi \cdot \frac{25^{\circ} 45^{\prime} 9^{\prime \prime}}{180^{\circ}} \cdot 6300 \mathrm{~km}=2832 \mathrm{~km}=1530 \mathrm{nmi}
$$

Answer: the distance from equator to the FIU is equal to 1530 nmi .
