

**Answer on Question #40970, Physics, Mechanics**

From point A to B on the rough surface, the cyclist lost 2000J of energy due to the frictional force of the rough surface of the 10 m road. She started with an initial speed  $v_A$  at point A, arriving at point B with a speed of  $v_B$ . The cyclist barely made it to the flat part (point C) of the frictionless surface without pedaling.

If the weight of the bike and the cyclist is 980N, and point C is located at  $h = 0.5$  m above the ground, find:

- The speed of cyclist at point B,  $v_B$
- The speed of cyclist at point A,  $v_A$
- The coefficient of kinetic friction,  $\mu_k$ , between the bike tires and the road.

**Solution**

If the weight of the bike and the cyclist is 980N, then mass of the bike and the cyclist is

$$m = \frac{W}{g} = \frac{980}{9.8} = 100 \text{ kg}.$$

According to the law of conservation of energy the kinetic energy at point A is equal the sum of the work against the frictional force and potential energy at point C:

$$\frac{mv_A^2}{2} = A + mgh.$$

The speed of cyclist at point A:

$$v_A = \sqrt{\frac{2A}{m} + 2gh} = \sqrt{\frac{2 \cdot 2000\text{J}}{100 \text{ kg}} + 2 \cdot 9.8 \frac{\text{m}}{\text{s}^2} \cdot 0.5 \text{ m}} = 7 \frac{\text{m}}{\text{s}}.$$

The kinetic energy of cyclist at point B is

$$\frac{mv_B^2}{2} = \frac{mv_A^2}{2} - A.$$

The speed of cyclist at point B:

$$v_B = \sqrt{v_A^2 - \frac{2A}{m}} = \sqrt{7^2 - \frac{2 \cdot 2000}{100}} = 3 \frac{\text{m}}{\text{s}}.$$

The coefficient of kinetic friction,  $\mu_k$ , between the bike tires and the road is

$$\mu_k = \frac{A}{W \cdot l} = \frac{2000\text{J}}{980\text{N} \cdot 10\text{m}} = 0.2.$$
