

Answer on Question #41465, Physics, Mechanics

A block of wood is placed on an inclined plane. The angle  $\theta$  (where  $\theta$  is non-zero) of the inclined plane is gradually increased until the block is at the verge of sliding down the incline. What is the coefficient of friction between the block and the incline?

- a.  $\cos\theta$  b.  $\tan\theta$  c.  $\sin\theta$  d.  $\cot\theta$

**Solution**

$F_{\parallel} = W \sin \theta$  and  $F_{\perp} = W \cos \theta$  are parallel and perpendicular projections of weight on an inclined plane.

For equilibrium, we must have  $F_{\perp} = W \cos \theta$ .

At a certain angle of inclination,  $\theta_k$ , at which the block slides down at constant velocity, the friction force  $F_k$  and  $F_{\parallel}$  become equal:

$$F_k = F_{\parallel} = W \sin \theta_k.$$

Since, by definition  $\mu_k = \frac{F_k}{N}$ , we may write:

$$\mu_k = \frac{W \sin \theta_k}{N} = \frac{W \sin \theta_k}{W \cos \theta_k} = \tan \theta_k.$$

**Answer: b.  $\tan\theta$ .**
