## Answer on Question \#42814, Physics, Mechanics

A buss tire rotates at an initial angular speed of $20.5 \mathrm{rad} / \mathrm{s}$. The driver accelerates, and after 4.5 s the tires angular speed is $29.0 \mathrm{rad} / \mathrm{s}$. What is the tires average angular acceleration during the 4.5 s time interval?
Solution
The change of speed is

$$
29-20.5=8.5 \mathrm{rad} / \mathrm{s}
$$

Then acceleration is

$$
n=\frac{8.5}{4.5} \approx 1.89 \mathrm{rad} / \mathrm{s}^{2}
$$
