

### Answer on Question #43049-Physics-Molecular Physics-Thermodynamics

A tank having volume of  $0.1\text{m}^3$  contains helium gas at  $150\text{atm}$  and fixed temperature at  $27^\circ\text{C}$  calculate

1-how many balloons can the tank blow up if each field balloons is a sphere  $0.3\text{m}$  in diameter at an absolute pressure of  $1.2\text{atm}$  at the same temperature

#### Solution

At constant temperature  $P_1V_1 = P_2V_2$ . (Boyle's law)

$$P_1 = 150 \text{ atm} = 1.515 \cdot 10^7 \text{ Pa}, V_1 = 0.1 \text{ m}^3.$$

$$P_2 = 1.2 \text{ atm} = 1.212 \cdot 10^5 \text{ Pa}.$$

$$V_2 = \frac{P_1V_1}{P_2} = \frac{1.515 \cdot 10^7 \cdot 0.1}{1.212 \cdot 10^5} = 12.5 \text{ m}^3.$$

Let  $n$  is number of balloons and  $V_b$  is the volume of each blown-up balloon.

$$V_b = \left(\frac{4\pi}{3}\right)r^3 = \left(\frac{4\pi}{3}\right)\left(\frac{0.3}{2}\right)^3 = 1.414 \cdot 10^{-2} \text{ m}^3.$$

$$n = \frac{V_2}{V_b} = \frac{12.5}{1.414 \cdot 10^{-2}} = 884.$$

The tank can blow up 884 balloons.

2-the work done and which do the work

#### Solution

In isothermal process gas expands to the new volume and work is done by the gas is

$$W = \int_{V_1}^{V_2} P dV,$$

$$\text{where } P = \nu RT \cdot \frac{1}{V}.$$

$$W = \int_{V_1}^{V_2} \nu RT \cdot \frac{1}{V} dV = \nu RT \ln \frac{V_2}{V_1} = P_1 V_1 \ln \frac{V_2}{V_1} = 1.515 \cdot 10^7 \cdot 0.1 \ln \frac{12.5}{0.1} = 7.31 \cdot 10^6 \text{ J} = 7.31 \text{ MJ}.$$

$W$  have sign "+", so the gas do the work.

3-the change in internal energy

#### Solution

Since the temperature and amount of gas is constant internal energy doesn't change:

$$\Delta U = 0.$$

4-the quantity of heat and is this must added or removed

#### Solution

Since the internal energy doesn't change according to the First law of thermodynamics:

$$Q = W = 7.31 \text{ MJ}.$$

As the gas expands, heat must be added.
