## Answer on Question \#43602, Physics, Mechanics | Kinematics | Dynamics

## Question:

Calculate the force needed to accelerate a $50-\mathrm{kg}$ boy at a rate of $10 \mathrm{~m} / \mathrm{s} 2$

## Answer:

Newton's second law of motion:
The acceleration of a body is directly proportional to, and in the same direction as, the net force acting on the body, and inversely proportional to its mass:

$$
a=\frac{F}{m}
$$

Therefore, the force needed to accelerate a $50-\mathrm{kg}$ boy at a rate of $10 \mathrm{~m} / \mathrm{s} 2$ equals:

$$
F=m a=50 \mathrm{~kg} \cdot 10 \frac{\mathrm{~m}}{\mathrm{~s}^{2}}=500 \mathrm{~N}
$$

Answer: 500 N
