

Answer on Question #44502, Physics, Other

A 12 g bullet is accelerated from rest to speed of 700m/s as it travels 20cm in a gun barrel. Assuming acceleration to be constant, how large was the accelerating force ?

Solution:

Given:

$$m = 12 \cdot 10^{-3} \text{ kg,}$$

$$v_0 = 0,$$

$$v = 700 \text{ m/s,}$$

$$d = 0.2 \text{ m,}$$

$$F = ?$$

Newton's Second Law

$$F = ma$$

Kinematics equation

$$2ad = v^2 - v_0^2$$

where a is acceleration, d is distance, v_0 is initial velocity and v is final velocity.

Thus,

$$a = \frac{v^2 - v_0^2}{2d}$$

So,

$$F = m \frac{v^2 - v_0^2}{2d}$$

Substituting,

$$F = 12 \cdot 10^{-3} \frac{700^2 - 0^2}{2 \cdot 0.2} = 14700 \text{ N}$$

Answer: $F = 14700 \text{ N.}$
